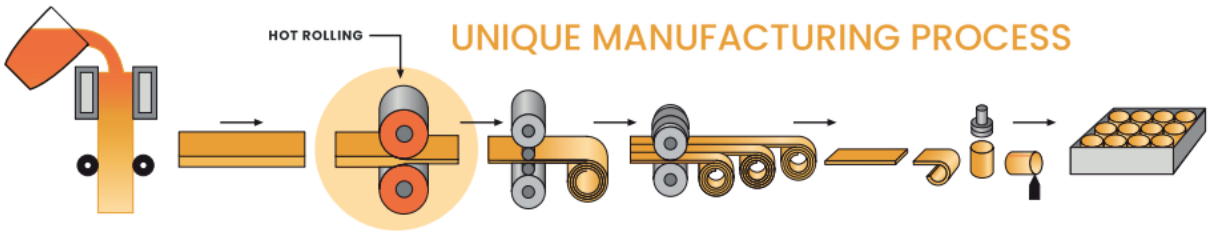
D&E Bearings
– SPECIALISTS SINCE 1966

Benefit from a stable, long-lasting bearing that cares for the environment!

The advantages of the WB8 D&E bronze plain bearing compared with the closest competitor, according to third-party analyses.

100% DENSER MICROSTRUCTURE THROUGH HOT ROLLING

The WB802 series undergoes more extensive material processing steps and is at least 100% denser than the closest competitor, thanks to the additional process step of hot rolling.



LONGER SERVICE LIFE & LOWER RISK

A 43% longer service life has been demonstrated in a separate third-party service life test. D&E has been carrying out technical analyses for more than 50 years, and together with Wieland Werke in Germany and our industry-leading customers we have developed this industry-leading bronze plain bearing, manufactured with 100% raw material control through both in-house raw material production and raw material refining.

This is an important part of our environmental work to contribute to sustainability and reduced climate impact.
